product proposed by each bidder in the auction, and a maximum margin of the price acceptable to pay proposed by each bidder via the network; and

if the auction assumes a competitive state by the desired price information proposed by [one of] the plurality of bidders [coincides with the desired price proposed by another bidder and the auction assumes a competitive state], resolving the competitive state in accordance with the maximum margins proposed by the competitive bidders.

(Amended) The <u>computer-implemented</u> auction method as claimed in claim 16, wherein said competitive state resolving step determines a successful bidder as the bidder having proposed the largest maximum margin.

28. (Amended) The <u>computer-implemented</u> auction method as claimed in claim 17, wherein said maximum margin is the difference between the price acceptable to pay and the desired price.

(Amended) The <u>computer-implemented</u> auction method as claimed in claim 16, further comprising the step of:

collecting an amount information on the product to be auctioned from each bidder.

20. (Amended) The <u>computer-implemented</u> auction method as claimed in claim 19, wherein said competitive state resolving step resolves the competitive state using said amount information.

21. (Amended) The <u>computer-implemented</u> auction method as claimed in claim 16, further comprising the step of:

continuing the auction after the competitive state resolving step.

(Amended) The <u>computer-implemented</u> auction method as claimed in claim 16, wherein said collecting step is performed before the auction starts.

23. (Amended) The <u>computer-implemented</u> auction method as claimed in claim 16, further comprising the step of:

if the auction does not assume a competitive state, determining a successful bidder as the bidder having proposed the highest desired price.

24. (Amended) [An] <u>A computerized</u> auction apparatus for performing an auction, the apparatus connected to a plurality of bidder terminals via a network, comprising:

means for providing information on a product to be auctioned via the network;

means for collecting [a] desired price <u>information</u>

<u>corresponding to a price desired to purchase</u> [for] the product

<u>proposed by each bidder in the auction</u>, and a maximum margin

[of] <u>corresponding to the price acceptable to pay proposed by each bidder via the network; and</u>

means, if the <u>auction assumes a competitive state by</u>
the desired price <u>information</u> proposed by [one of] the
plurality of bidders [councides with the desired price
proposed by another bidder and the auction assumes a
competitive state], for resolving the competitive state in
accordance with the maximum margins proposed by the
competitive bidders.

25. (Amended) The <u>computerized</u> auction apparatus as claimed in claim 24, wherein said competitive state resolving means determines a successful bidder as the bidder having proposed the largest maximum margin.

(Amended) The <u>computerized</u> auction apparatus as claimed in claim 25, wherein said maximum margin is the difference between the price acceptable to pay and the desired price.

27. (Amended) The <u>computerized</u> auction apparatus as claimed in claim 24, further comprising:

means for collecting an amount information on the product to be auctioned from each bidder.

AB. (Amended) The <u>computerized</u> auction [method] apparatus as claimed in claim 21, wherein said competitive state resolving means resolves the competitive state using said amount information.

29. (Amended) The <u>computerized</u> auction apparatus as claimed in claim [23] 24, further comprising:

means for continuing the auction after said competitive state resolves.

(Amended) The <u>computerized</u> auction apparatus as claimed in claim [23] 24, wherein collection by said collecting means is performed before the auction starts.

(Amended) The <u>computerized</u> auction apparatus as claimed in claim [23] 24, further comprising:

means, if the auction does not assume a competitive state, for determining a successful bidder as the bidder having proposed the highest desired price.

(Amended) [An] <u>A computerized</u> auction apparatus for performing an auction, the apparatus connected to a plurality of bidder terminals via a network, comprising:

a storage device storing a program; and a processor, connected to said storage device, executing the following steps according to the program:

providing information on a product to be auctioned via the network;

collecting [a] desired price [for] <u>information</u> corresponding to a price desired to purchase the product proposed by each hidder in the auction, and a maximum margin corresponding to [of] the price acceptable to pay proposed by each bidder via the network; and

if the <u>auction assumes a competitive state by</u>
the desired price <u>information</u> proposed by [one of] the
plurality of bidders [coincides with the desired price
proposed by another bidder and the auction assumes a
competitive state], resolving the competitive state in
accordance with the maximum margins proposed by the
competitive bidders.

33. (Amended) A program storage device readable and executable by an auction apparatus for performing an auction method, the apparatus connected to a plurality of bidder terminals via a network, said method including the following steps:

providing information on a product to be auctioned via the network;
